

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently amended): A method in an automatic teller machine for processing checks, the method comprising:
receiving a customer check issued by a customer at the automatic teller machine;
scanning the customer check to create an image of the customer check;
identifying an amount for the customer check; [[and]]
creating a new printed certified check for the amount, wherein the new printed certified check includes a digital watermark identifying a financial institution for an account on which the customer check is issued, and wherein funds for the amount are guaranteed by the financial institution; and
sending a check use alert to customers associated with the account.
2. (Previously presented): The method of claim 1 further comprising:
verifying funds are available in the account on which the customer check is issued prior to creating the new printed certified check.
3. (Previously presented): The method of claim 1 further comprising:
dispensing the new printed certified check to the customer at the automatic teller machine.
4. (Canceled)
5. (Previously presented): The method of claim 1 further comprising:
sending the new printed certified check to a third party designated by the customer at the automatic teller machine.
6. (Previously presented): The method of claim 5, wherein the new printed certified check is sent to the third party as an electronic certified check.
7. (Currently amended): A method in an automatic teller machine for processing checks, the method comprising:
receiving a check from a customer at the automatic teller machine;

scanning the check to create an image of the check;

searching the image of the check for an overlaid digital watermark identifying a financial institution for an account on which the check is issued;

responsive to identifying the overlaid digital watermark in the image of the check, determining whether the overlaid digital watermark is authentic by comparing the overlaid digital watermark identified in the image of the check to a watermark associated with the financial institution for the account on which the check is issued to see if a match occurs, wherein the overlaid digital watermark is authentic if the match occurs; [[and]]

responsive to the overlaid digital watermark being authentic, providing financial services to the customer; and

sending a check use alert to customers associated with the account.

8. (Canceled)

9. (Previously presented): The method of claim 7, wherein the step of providing financial services comprises:

determining whether funds are available in the account on which the check is issued to cover an amount of the check.

10. (Original): The method of claim 9, wherein the step of providing financial services further comprises:

initiating a funds transfer for the amount of the check in response to a determination that funds are available to cover the amount of the check.

11. (Original): A method in an automatic teller machine for issuing an identification card, the method comprising:

receiving a request from a user at the automatic teller machine to issue the identification card;

verifying an identification of the user;

responsive to the identification of the user being verified, capturing an image of the user;

retrieving user information associated with the user for use in generating the identification card;

and

generating the identification card using the image and the user information.

12. (Original): The method of claim 11 further comprising:
dispensing the identification card to the user.
13. (Currently amended): A data processing system in an automatic teller machine for processing checks, the data processing system comprising:
receiving means for receiving a customer check issued by a customer at the automatic teller machine;
scanning means for scanning the customer check to create an image of the customer check;
identifying means for identifying an amount for the customer check; [[and]]
creating means for creating a new printed certified check for the amount, wherein the new printed certified check includes a digital watermark identifying a financial institution for an account on which the customer check is issued, and wherein funds for the amount are guaranteed by the financial institution;
and
sending means for sending a check use alert to customers associated with the account.
14. (Previously presented): The data processing system of claim 13 further comprising:
verifying means for verifying funds are available in the account on which the customer check is issued prior to creating the new printed certified check.
15. (Previously presented): The data processing system of claim 13 further comprising:
dispensing means for dispensing the new printed certified check to the customer at the automatic teller machine.
16. (Canceled)
17. (Previously presented): The data processing system of claim 13 further comprising:
sending means for sending the new printed certified check to a third party designated by the customer at the automatic teller machine.
18. (Previously presented): The data processing system of claim 17, wherein the new printed certified check is sent to the third party as an electronic certified check.
19. (Currently amended): A data processing system in an automatic teller machine for processing checks, the data processing system comprising:

receiving means for receiving a check from a customer at the automatic teller machine;
scanning means for scanning the check to create an image of the check;
searching means for searching the image of the check for an overlaid digital watermark
identifying a financial institution for an account on which the check is issued;
identifying means, responsive to identifying the overlaid digital watermark in the image of the
check, for determining whether the overlaid digital watermark is authentic by comparing the overlaid
digital watermark identified in the image of the check to a watermark associated with the financial
institution for the account on which the check is issued to see if a match occurs, wherein the overlaid
digital watermark is authentic if the match occurs; [[and]]
providing means, responsive to the overlaid digital watermark being authentic, for providing
financial services to the customer; and
sending a check use alert to customers associated with the account.

20. (Canceled)

21. (Previously presented): The data processing system of claim 19, wherein the step of providing
financial services comprises:

determining means for determining whether funds are available in the account on which the check
is issued to cover an amount of the check.

22. (Original): The data processing system of claim 21, wherein the step of providing financial
services further comprises:

initiating means for initiating a funds transfer for the amount of the check in response to a
determination that funds are available to cover the amount of the check.

23. (Original): A data processing system in an automatic teller machine for issuing an identification
card, the method comprising:

receiving means for receiving a request from a user at the automatic teller machine to issue the
identification card;

verifying means for verifying an identification of the user;

capturing means, responsive to the identification of the user being verified, for capturing an
image of the user; and

retrieving means for retrieving user information associated with the user for use in generating the identification card;

generating means for generating the identification card using the image and the user information.

24. (Original): The data processing system of claim 23 further comprising:
dispensing means for dispensing the identification card to the user.

25. (Currently amended): A data processing system in an automatic teller machine for processing checks, the data processing system comprising:
a bus system;
a communications unit connected to the bus system;
a memory connected to the bus system, wherein the memory includes a set of instructions; and
a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to receive a customer check issued by a customer at the automatic teller machine, scan the customer check to create an image of the customer check, identify an amount for the customer check, [[and]] create a new printed certified check for the amount, wherein the new printed certified check includes a digital watermark identifying a financial institution for an account on which the customer check is issued, and wherein funds for the amount are guaranteed by the financial institution, and send a check use alert to customers associated with the account.

26. (Previously presented): The data processing system of claim 25, wherein the processing unit further executes the set of instructions to verify funds are available in the account on which the customer check is issued prior to creating the new printed certified check.

27. (Previously presented): The data processing system of claim 25, wherein the processing unit further executes the set of instructions to dispense the new printed certified check to the customer at the automatic teller machine.

28. (Canceled)

29. (Previously presented): The data processing system of claim 25 wherein the processing unit further executes the set of instructions to send the new printed certified check to a third party designated by the customer at the automatic teller machine.

30. (Previously presented): The data processing system of claim 29, wherein the new printed certified check is sent to the third party as an electronic certified check.
31. (Currently amended): A data processing system in an automatic teller machine for processing checks, the data processing system comprising:
- a bus system;
 - a communications unit connected to the bus system;
 - a memory connected to the bus system, wherein the memory includes a set of instructions; and
 - a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to receive a check from a customer at the automatic teller machine; scan the check to create an image of the check; search the image of the check for an overlaid digital watermark identifying a financial institution for an account on which the check is issued; determine whether the overlaid digital watermark is authentic in response to identifying the overlaid digital watermark in the image of the check by comparing the overlaid digital watermark identified in the image of the check to a watermark associated with the financial institution for the account on which the check is issued to see if a match occurs, wherein the overlaid digital watermark is authentic if the match occurs; [[and]] provide financial services to the customer in response to the overlaid digital watermark being authentic; and send a check use alert to customers associated with the account.
32. (Canceled)
33. (Previously presented): The data processing system of claim 31, wherein the processing unit executes the set of instructions to provide by determining whether funds are available in the account on which the check is issued to cover an amount of the check.
34. (Original): The data processing system of claim 33, wherein the processing unit executes the set of instructions to provide by initiating a funds transfer for the amount of the check in response to a determination that funds are available to cover the amount of the check.
35. (Original): A data processing system in an automatic teller machine for issuing an identification card, the data processing system comprising:
- a bus system;
 - a communications unit connected to the bus system;
 - a memory connected to the bus system, wherein the memory includes a set of instructions; and

a processing unit connected to the bus system, wherein the processing unit executes the set of instructions to receive a request from a user at the automatic teller machine to issue the identification card; verify an identification of the user; capture an image of the user in response to the identification of the user being verified; retrieve user information associated with the user for use in generating the identification card; and generate the identification card using the image and the user information.

36. (Original): The data processing system of claim 35, wherein the processing unit further executes the set of instructions to dispense the identification card to the user.

37. (Currently amended): A computer program product in a computer readable medium for processing checks, the computer program product comprising:

first instructions for receiving a customer check issued by a customer at the automatic teller machine;

second instructions for scanning the customer check to create an image of the customer check;

~~second~~ third instructions for identifying an amount for the customer check; [[and]]

[[third]] fourth instructions for creating a new printed certified check for the amount, wherein the new printed certified check includes an digital watermark identifying a financial institution for an account on which the customer check is issued, and wherein funds for the amount are guaranteed by the financial institution; and

fifth instructions for sending a check use alert to customers associated with the account.

38. (Currently amended): The computer program product of claim 37 further comprising:

fourth sixth instructions for verifying funds are available in the account on which the customer check is issued prior to creating the new printed certified check.

39. (Currently amended): The computer program product of claim 37 further comprising:

fourth sixth instructions for dispensing the new printed certified check to the customer at the automatic teller machine.

40. (Canceled)

41. (Currently amended): The computer program product of claim 37 further comprising:

fourth sixth instructions for sending the new printed certified check to a third party designated by the customer at the automatic teller machine.

42. (Previously presented): The computer program product of claim 41, wherein the new printed certified check is sent to the third party as an electronic certified check.

43. (Currently amended): A computer program product in a computer readable medium for processing checks, the computer program product comprising:

first instructions for receiving a check from a customer at the automatic teller machine;

second instructions for scanning the check to create an image of the check;

third instructions for searching the image of the check for an overlaid digital watermark identifying a financial institution for an account on which the check is issued;

fourth instructions, responsive to identifying the overlaid digital watermark in the image of the check, for determining whether the overlaid digital watermark is authentic by comparing the overlaid digital watermark identified in the image of the check to a watermark associated with the financial institution for the account on which the check is issued to see if a match occurs, wherein the overlaid digital watermark is authentic if the match occurs; [[and]]

fifth instructions, responsive to the overlaid digital watermark being authentic, for providing financial services to the customer; and

sixth instructions for sending a check use alert to customers associated with the account.

44. (Canceled)

45. (Previously presented): The computer program product of claim 43, wherein the fifth instructions comprises:

first sub-instructions for determining whether funds are available in the account on which the check is issued to cover an amount of the check.

46. (Original): The computer program product of claim 45, wherein the fifth instructions comprises:

second sub-instructions for initiating a funds transfer for the amount of the check in response to a determination that funds are available to cover the amount of the check.

47. (Original): A computer program product in a computer readable medium for issuing an identification card, the computer program product comprising:

first instructions for receiving a request from a user at the automatic teller machine to issue the identification card;

second instructions for verifying an identification of the user;

third instructions, responsive to the identification of the user being verified, capturing an image of the user;

fourth instructions for retrieving user information associated with the user for use in generating the identification card;

fifth instructions for generating the identification card using the image and the user information.

48. (Original): The computer program product of claim 47 further comprising:

fifth instructions for dispensing the identification card to the user.

49. (New): The method of claim 1, further comprising:

responsive to receiving the customer check, capturing an image of the customer, wherein the check use alert includes the image of the customer attached to the image of the customer check.

50. (New): The method of claim 7, further comprising:

responsive to receiving the check, capturing an image of the customer, wherein the check use alert includes the image of the customer attached to the image of the check.

51. (New): The data processing system of claim 13, wherein an image of the customer is captured in response to receiving the customer check, and wherein the check use alert includes the image of the customer attached to the image of the customer check.

52. (New): The data processing system of claim 19, wherein an image of the customer is captured in response to receiving the check, and wherein the check use alert includes the image of the customer attached to the image of the check.

53. (New): The data processing system of claim 25, wherein an image of the customer is captured in response to receiving the customer check, and wherein the check use alert includes the image of the customer attached to the image of the customer check.

54. (New): The data processing system of claim 31, wherein an image of the customer is captured in response to receiving the check, and wherein the check use alert includes the image of the customer attached to the image of the check.

55. (New): The computer program product of claim 37, wherein an image of the customer is captured in response to receiving the customer check, and wherein the check use alert includes the image of the customer attached to the image of the customer check.

56. (New): The computer program product of claim 43, wherein an image of the customer is captured in response to receiving the check, and wherein the check use alert includes the image of the customer attached to the image of the check.
